# Fuzzing GPRS Layer-2 for Fun and Profit

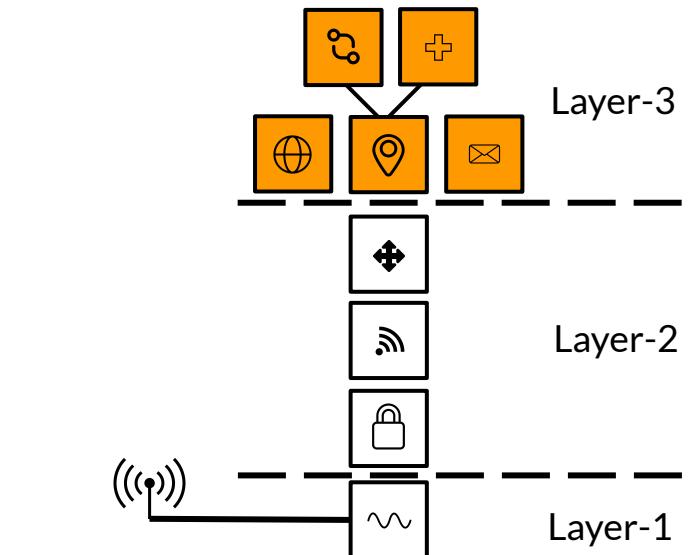

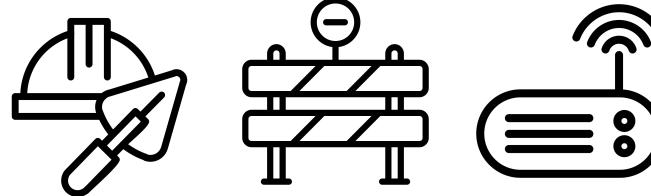

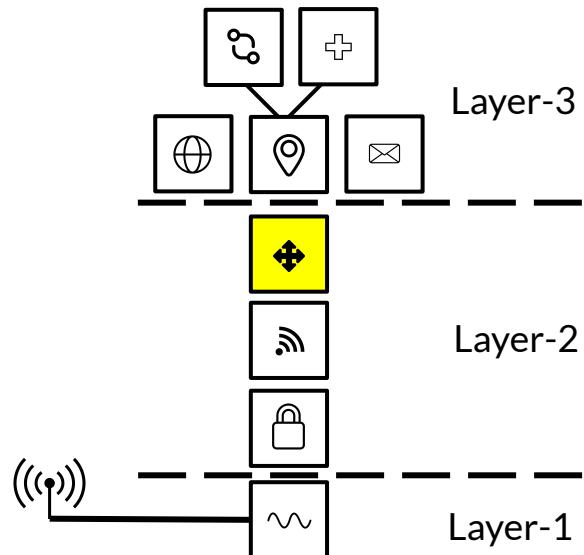

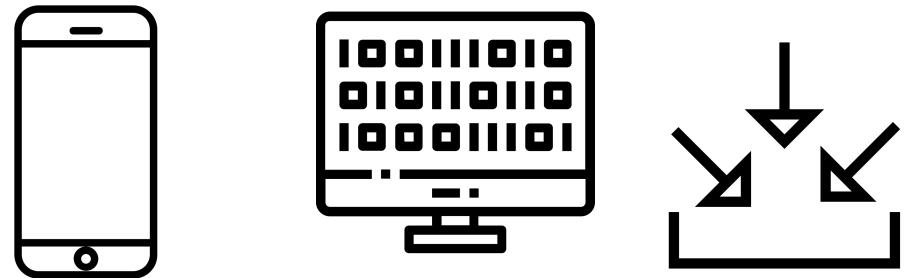

**hardware.io**

Hardware Security Conference and Training

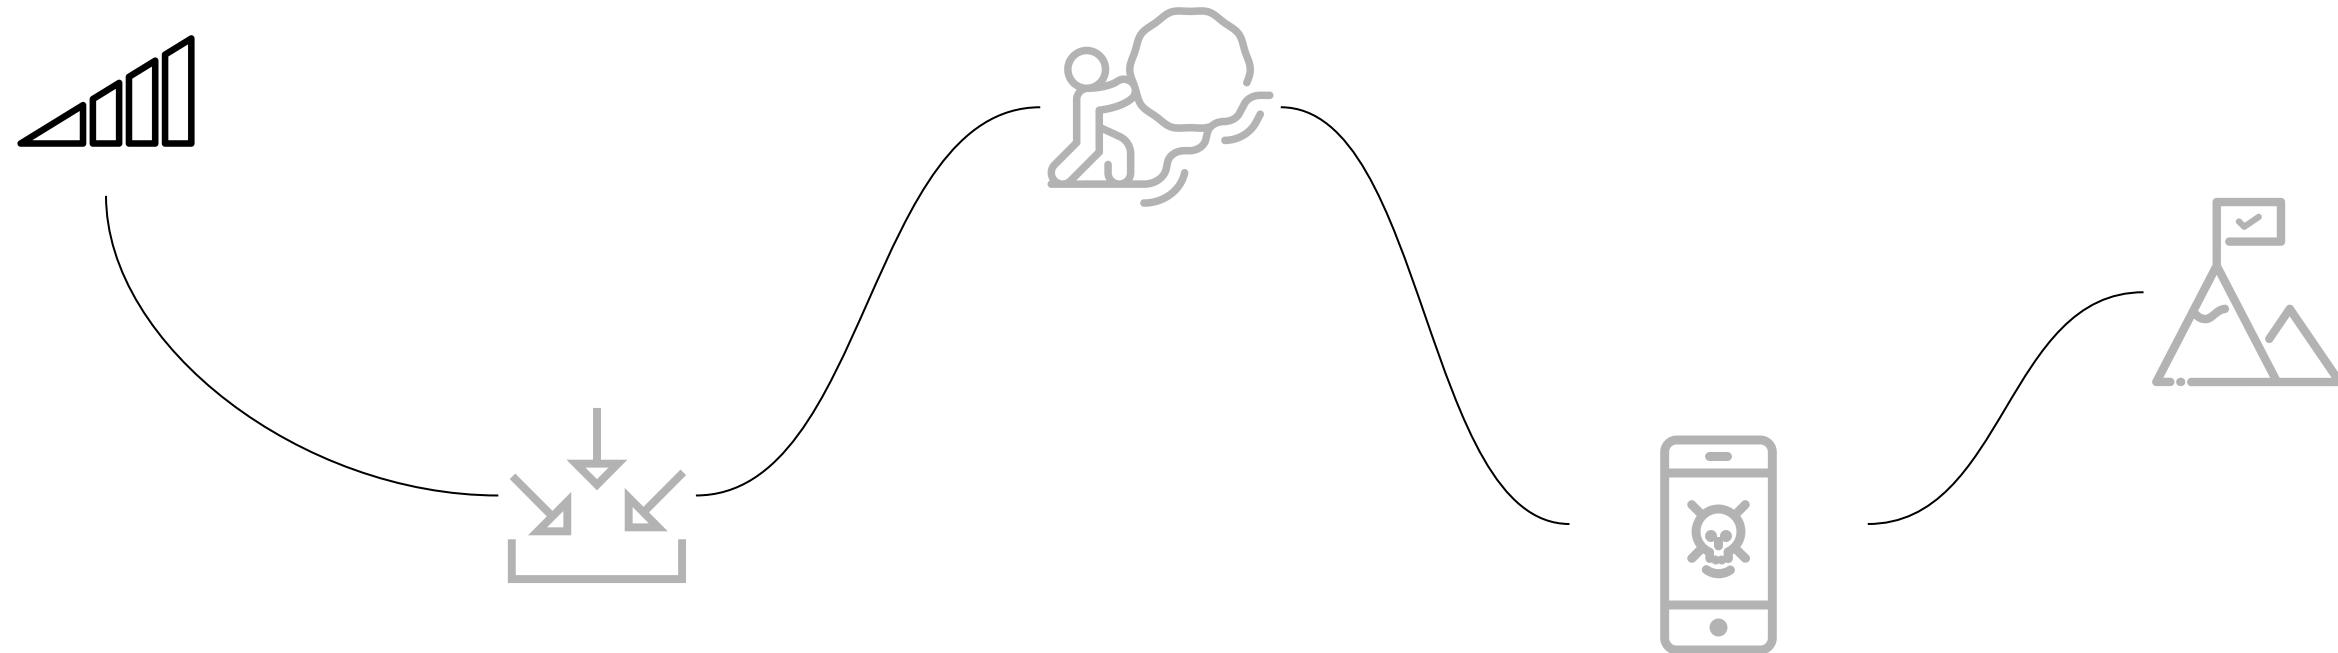

---

Dyon Goos & Marius Muench

# This talk

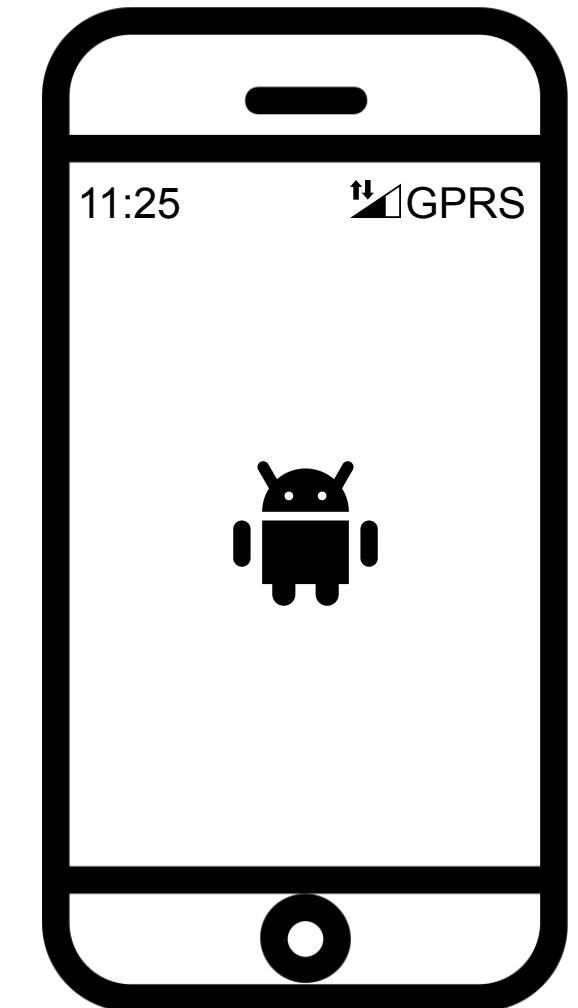

# Basebands

# Basebands

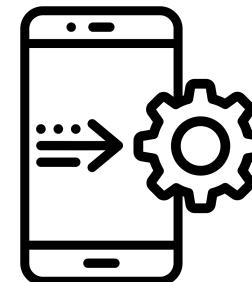

- Modern phones are a collection of processors
  - Including: Application Processor (AP) & Cellular Processor (CP)
- CP also referred to as “Baseband”
  - Implements most layers of cellular communication stack
- Lucrative attack surface
  - Myriad of parsers, legacy code, obscure features

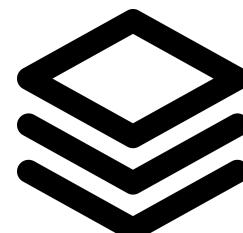

---

# The code running on basebands

Custom Real-Time Operating Systems (RTOS), providing:

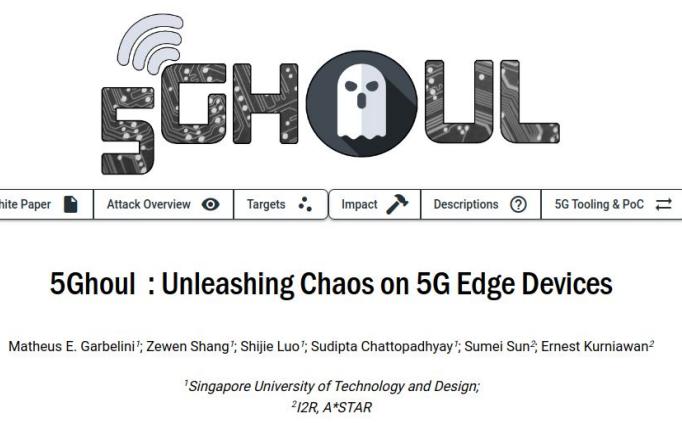

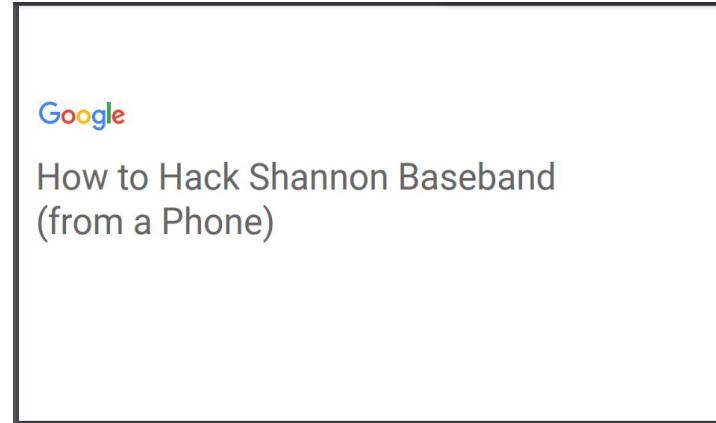

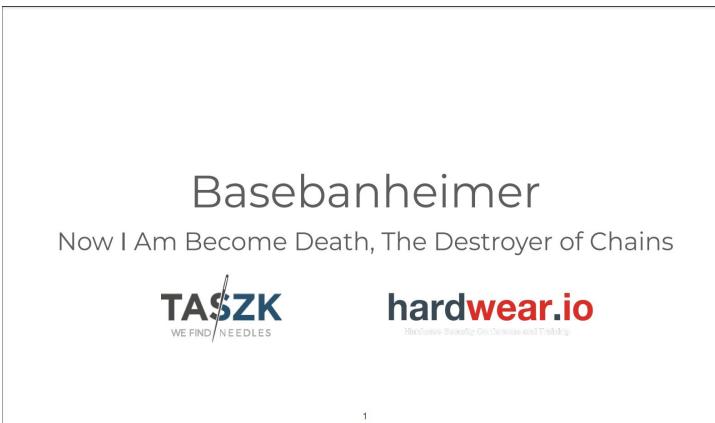

- Core OS functionality:
  - Scheduler, timers, interrupts
  - Messaging

- Cellular stack implementation:
  - Stack is split into “tasks”
  - Tasks communicate via message queues

# Baseband Security Research

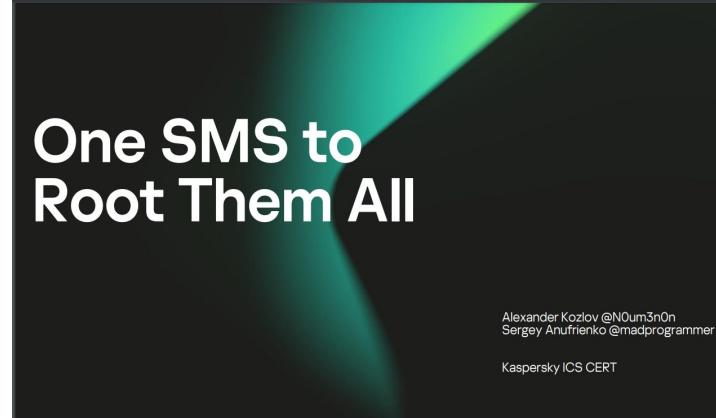

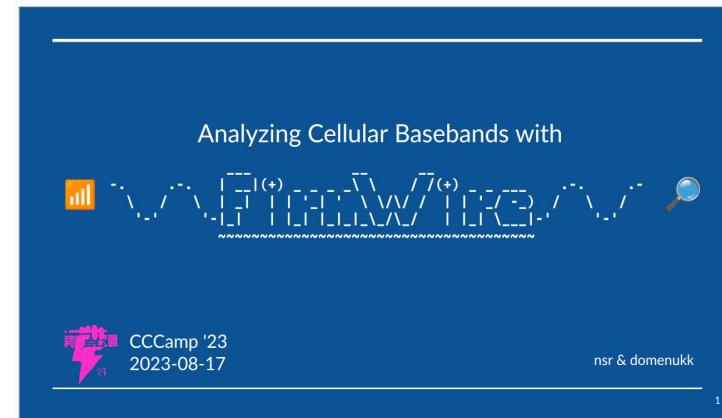

Plenty of attention in recent years, e.g.:

## There will be Bugs: Exploiting Basebands in Radio Layer Two

Daniel Komaromy

Baseband exploitation in public originally focused on message decoding bugs in layer 3 (NAS and RRC) and more recently in layer 4 (traffic over IP). In this presentation we uncover a new area of exploration for remote baseband exploitation in layer 2. In the past, this part of cellular specifications has been overlooked due to its function and packet size limitations. However, a deeper dive uncovers possibilities that show up in both old and new standards. Importantly, this is a layer that is below the ciphering applied to cellular communications providing an attack surface reachable not only with fake base stations but with direct MITM-ing of legitimate cell tower communications too. The presentation will describe the chain of vulnerabilities we have found and explain how to exploit them for remote code execution in the baseband of flagship Samsung smartphones. The new class of bugs meant new challenges both in developing and delivering an exploit. I will describe how we have modified radio software to inject a more complex sequence of malicious layer two traffic without the

## Cracking the 5G Fortress: Peering Into 5G's Vulnerability Abyss

# What about Layer-2?

When we started, most research/findings focus on cellular L3 (or higher)

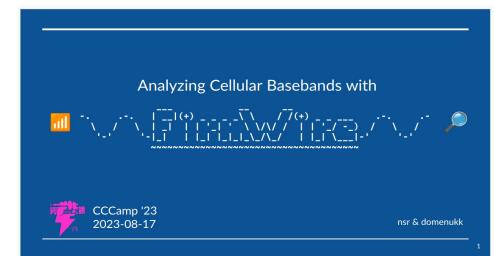

🤔 Let's have a look at layer-2 ourselves!

⇒ Let's start with legacy stacks first:

- GSM Layer-2
- GPRS Layer-2

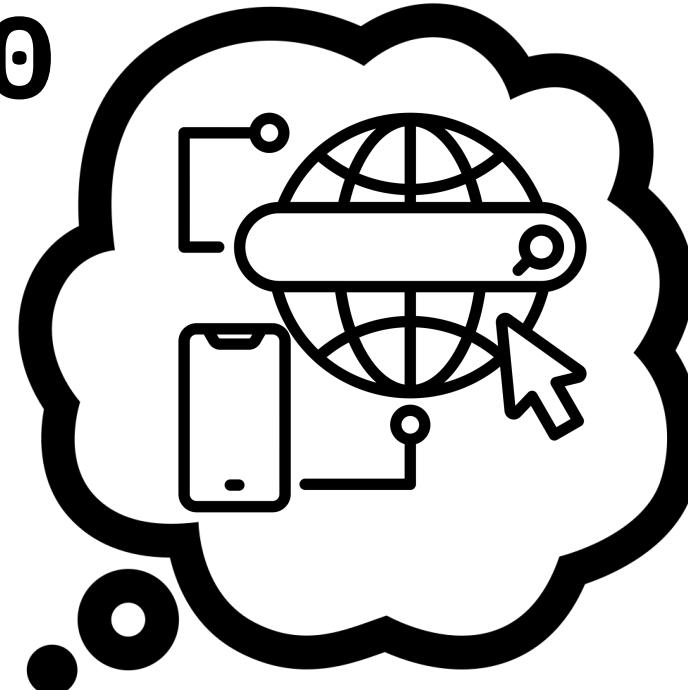

Baseband exploitation in public originally focused on message decoding bugs in layer 3 (NAS and RCC) and more recently in layer 4 (traffic over IP). In this presentation we uncover a new area of exploration for remote baseband exploitation in layer 2. In the past, this part of cellular specifications has been overlooked due to its function and packet size limitations. However, a deeper dive uncovers possibilities that show up in both old and new standards. Importantly, this is a layer that is below the ciphering applied to cellular communications providing an attack surface reachable not only with fake base stations but with direct MITM-ing of legitimate cell tower communications too. The presentation will describe the chain of vulnerabilities we have found and explain how to exploit them for remote code execution in the baseband of flagship Samsung smartphones. The new class of bugs meant new challenges both in developing and delivering an exploit. I will describe how we have modified radio software to inject a more complex sequence of malicious layer two traffic without the

**Around 2000**

**GSM: Circuit Switched**

**Solution : GSM++ aka GPRS  
aka General Packet Radio  
Service aka 2.5G**

# GPRS Protocol stack

**SM:** Session Management

**SS:** Supplementary Services

**SNDCP:** Sub Network Dependent Convergence Protocol

**GMM:** GPRS Mobility Management

**SMS :** Short Messaging Service

**LLC:** Logical Link Control

**RLC:** Radio Link Control

**MAC:** Medium Access Control

**Phy :** Physical

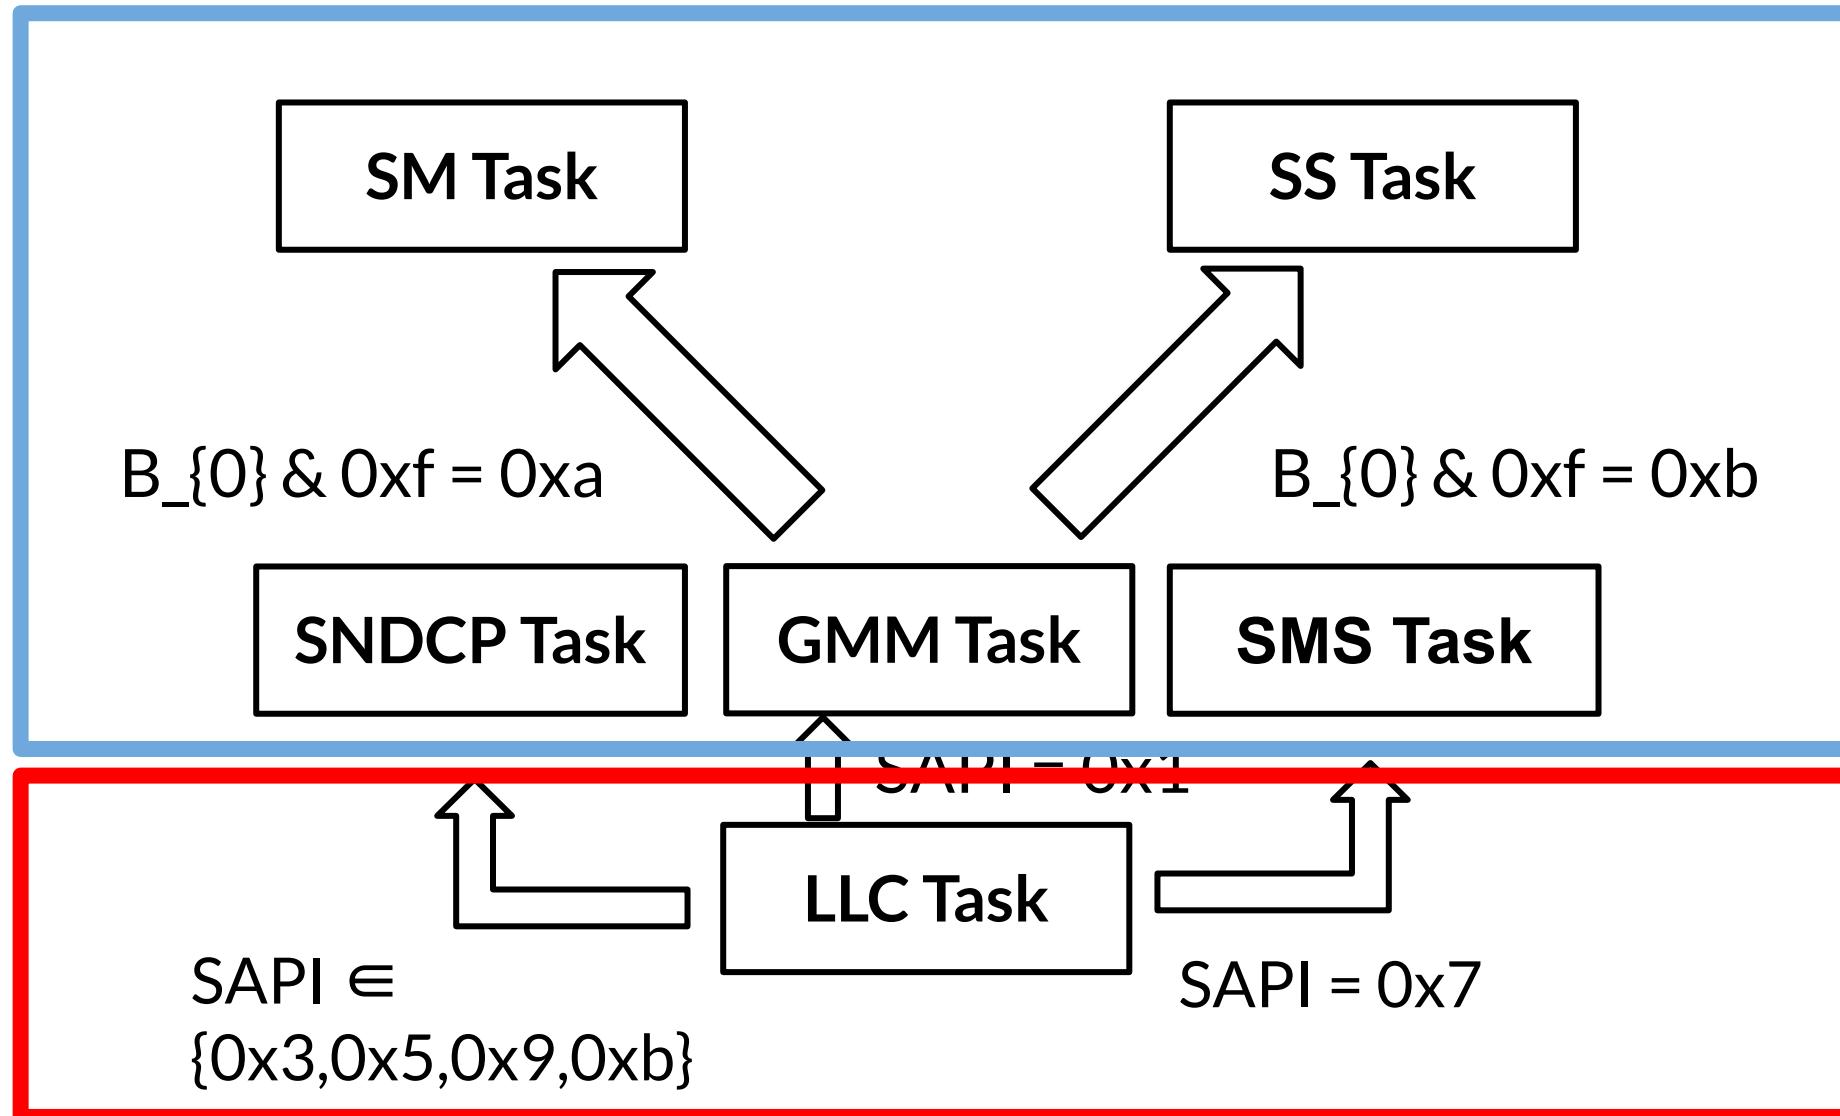

# GPRS Layer 2

```
struct qitem_llc{  
    struct qitem_header header;  
    uint32_t tlli;  
    struct qitem_llc_pdu *pdu;  
    uint32_t length;  
} PACKED;
```

```
struct qitem_llc_pdu{  
    uint8_t address;  
    uint16_t control;  
    char information[N];  
    uint8_t[3] CRC;  
} PACKED;
```

- **TLLI**: Temporary Logical Link Identifier
- **PDU**: Protocol Data Unit
  - **Information**: L3 data
  - **CRC**: 3 bytes Cyclic Redundancy Check (CRC)
  - **Address Field**
    - **SAPI**: Service Access Point Identifier

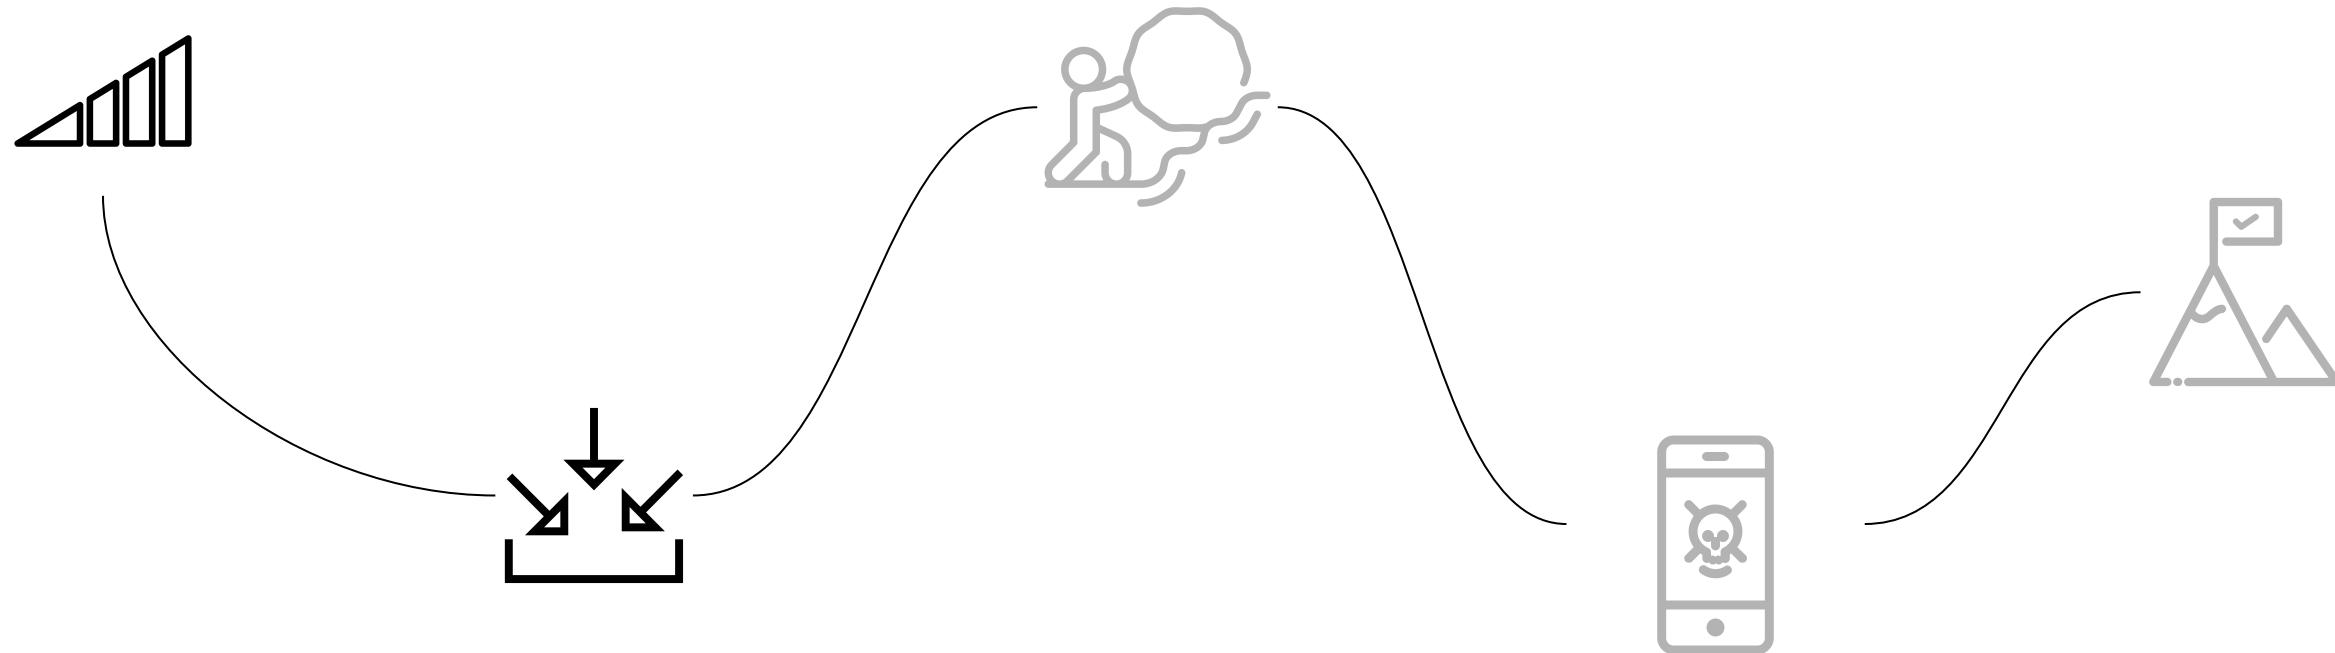

# GPRS Layer 2/3

- **Information:**  
 $B_{\{0\}} \dots B_{\{N\}}$

---

# Our Approach to Fuzzing

# Our Fuzzing Campaigns: FirmWire

- Full-system baseband emulator
  - Baseband emulation from boot
  - Fuzzing support via AFL++
  - Support for MTK & Exynos firmware
- Advantages:
  - Analyzable logs
  - Coverage tracking
  - Task-interaction

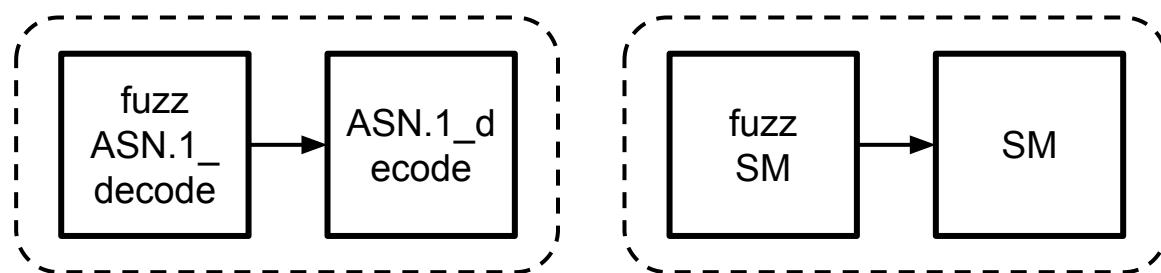

# Fuzzing in FirmWire

- Requires injection of “Fuzzing Task”
  - Written in C, AFL wrapper present
  - Appears like an ordinary task for emulated CP
  - Sends messages to other tasks

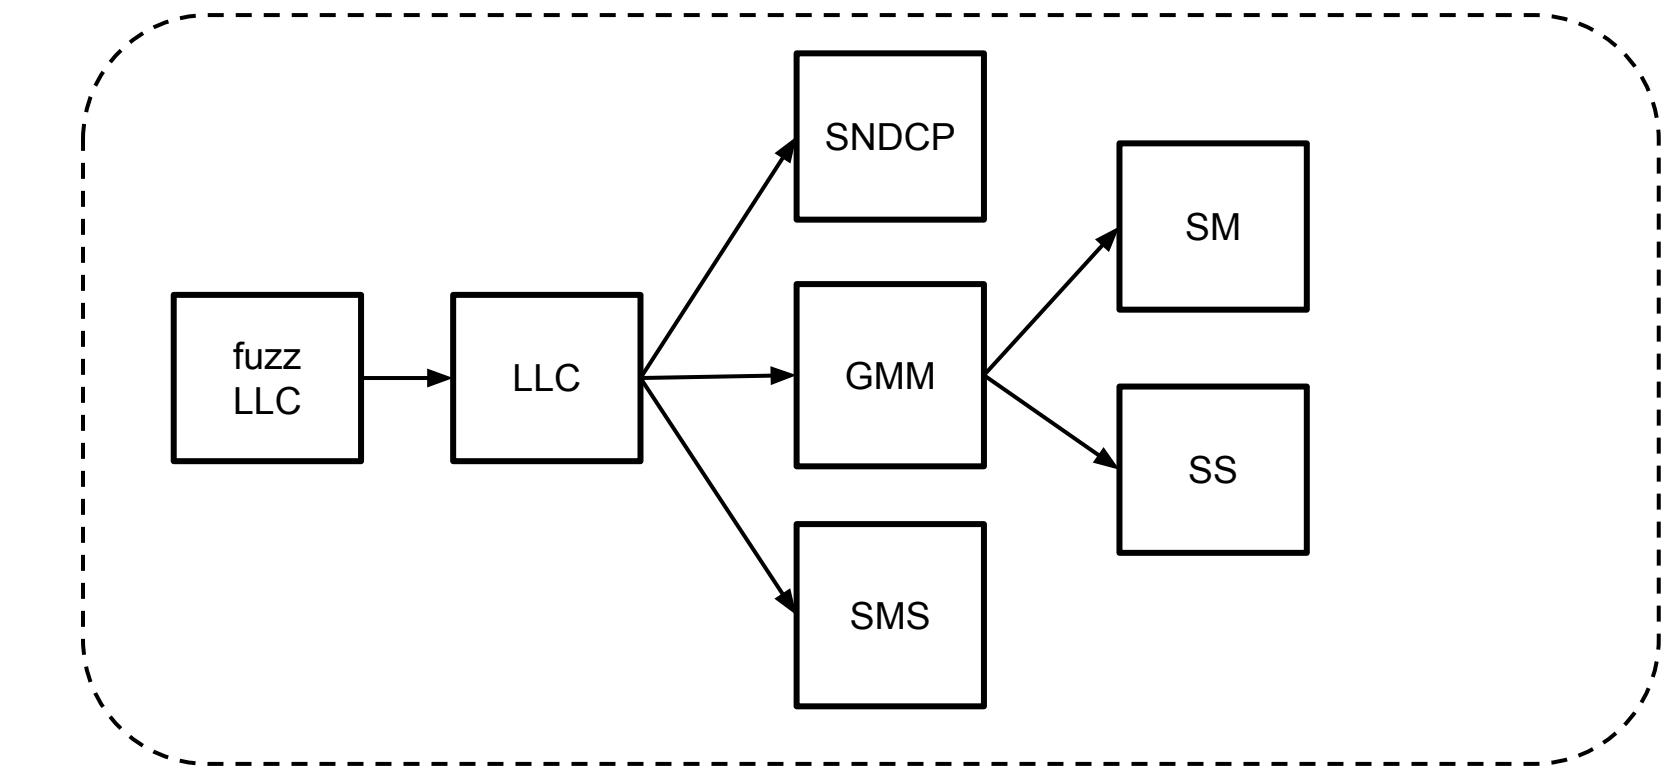

```
int fuzz_single_setup()
{
    qid = queuename2id("TARGET_TASK_QUEUE");
    struct qitem_target * init =
        pal_MemAlloc(4, sizeof(struct
            qitem_target), __FILE__, __LINE__);
    // setup init payload
    [...]
    pal_MsgSendTo(qid, init, 2);
    return 1;
}
```

# The Plan: Fuzzing Layer-2

Existing Fuzzers (non-OTA)

Our Approach (GPRS)

---

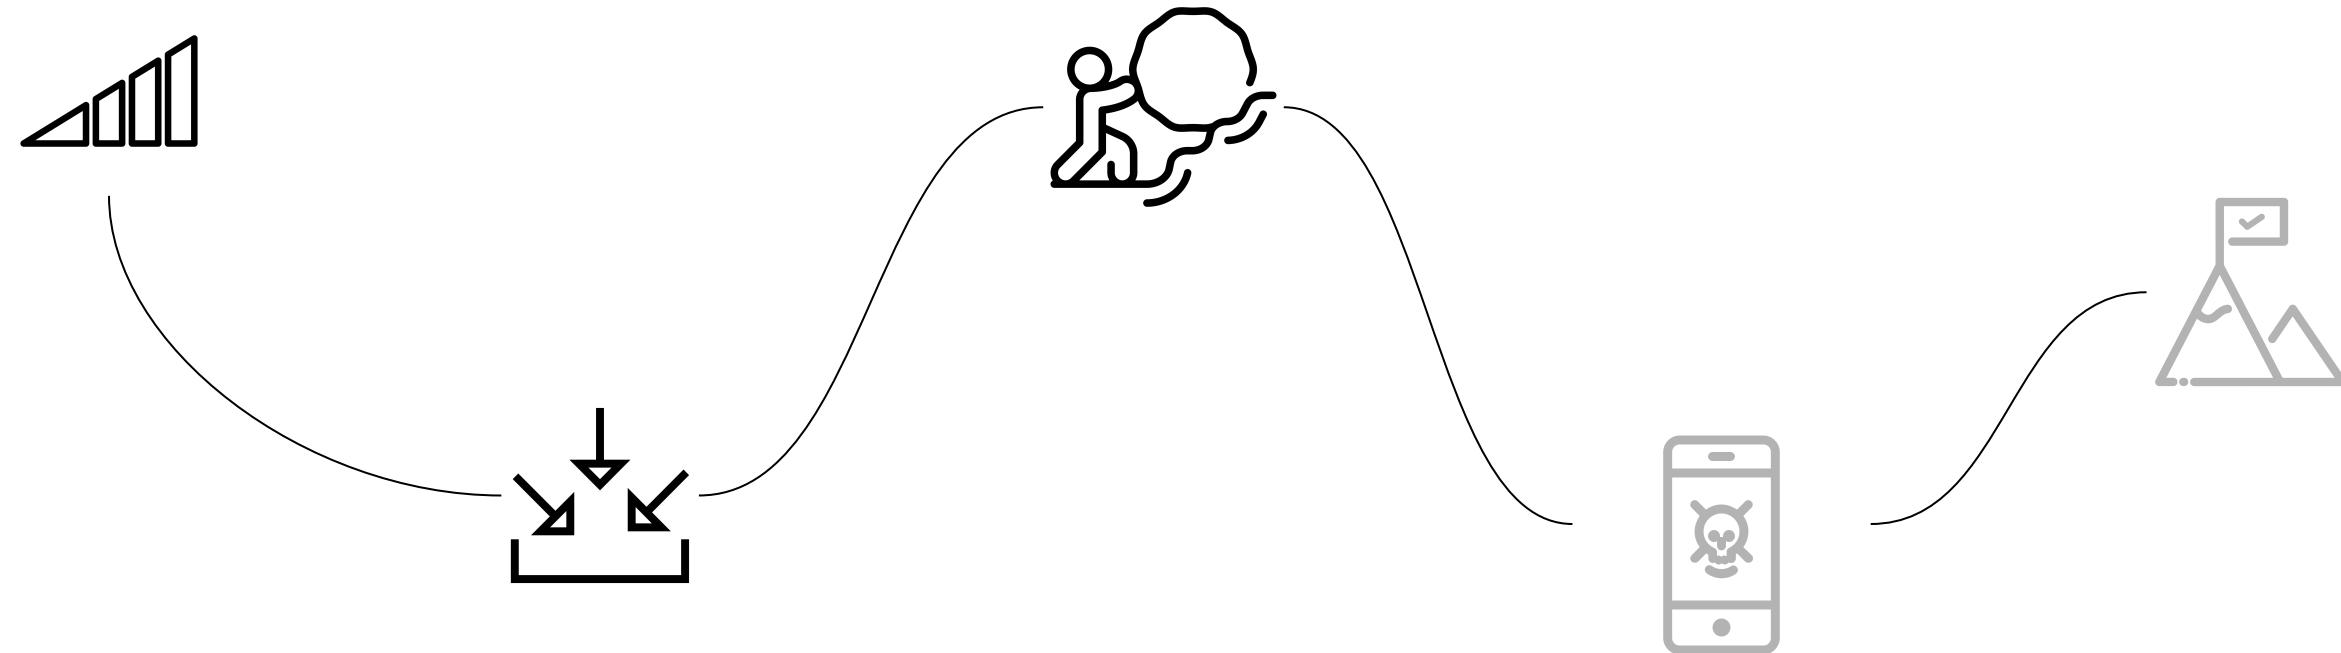

# The Target: Galaxy S10e Firmware

- Latest phone model supported by FirmWire
- Released date: 2019
- Firmware date: March 2023
  - Original FirmWire bugs are patched

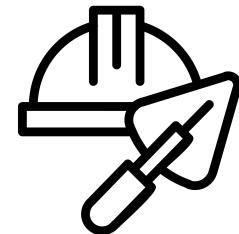

---

# Challenges

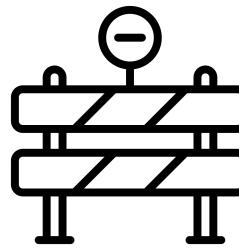

---

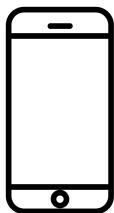

# The Challenges

Need to create fuzzing task

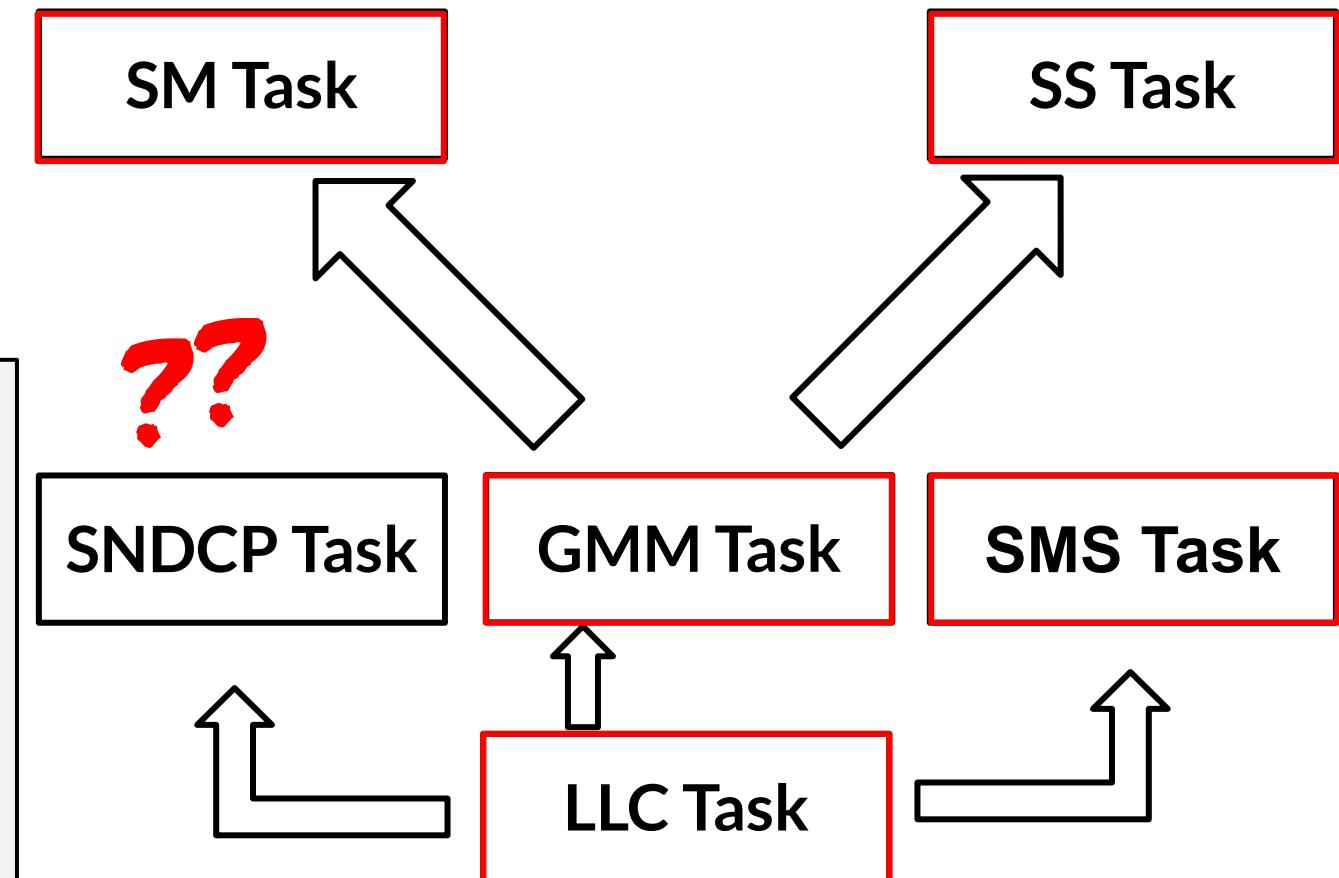

How to deal with complex baseband state

No support for recent phones

# Challenge 1A: Creating Fuzzing Task

```
//Initialize LLC task  
  
//Initialize SMS task  
  
S  
q  
i  
i  
i  
i  
i //Initialize SS task  
i  
i  
i  
i  
i //Initialize SM task  
i  
i struct qitem_sm * init = pal_MemAlloc(4, sizeof(struct  
qitem_sm), __FILE__, __LINE__);  
p  
init->header.op = 0;  
init->header.size = 1;  
init->header.msgGroup = 0x3407;  
  
pal_MsgSendTo(queuename2id("SM"), init, 2);  
  
pal_MsgSendTo(queuename2id("SS"), init, 2);
```

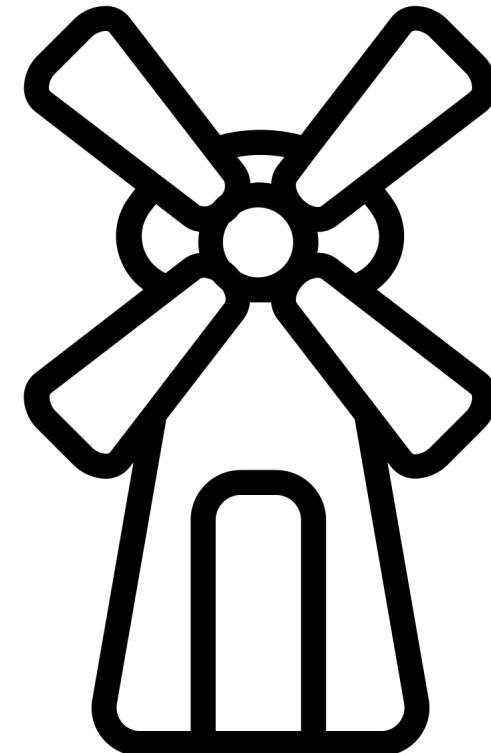

# Challenge 1B: Creating Fuzzing Task ++

- Some tasks
- Pseudo code // Setup
- ..
- send\_sns
- send\_fir
- ..

```
int send_first_xid_block(uint8_t isHdr_isData_XID, uint8_t N, uint8_t num_of_xid_params){  
    int data; // Local variable  
    <...> alloc + set item  
    uint8_t xid_sapi = 0x3;  
    xid->payload[0] = xid_sapi;  
    uint8_t *xid_block = pal_MemAlloc(4, 11, __FILE__, __LINE__);  
    *(uint32_t*)(xid->payload + 0x8) = xid_block;  
    *(uint32_t*)(xid->payload + 0xc) = num_of_xid_params;  
    uint8_t algorithm_type = 0x0;  
    uint8_t NSAPIs = nsapi;  
    uint8_t entity_num = 0x0;  
    uint8_t DPCOMP1 = 0x1;  
    uint8_t DPCOMP2 = 0x0;  
    construct_xid_block(xid_block, algorithm_type, NSAPIs, N - 3, isHdr_isData_XID,  
    entity_num, DPCOMP1, DPCOMP2);  
    pal_MsgSendTo(queuename2id("SNDCP"), xid, 2);  
}
```

- 
- All tasks are initialized, we should now be able to start fuzzing ....

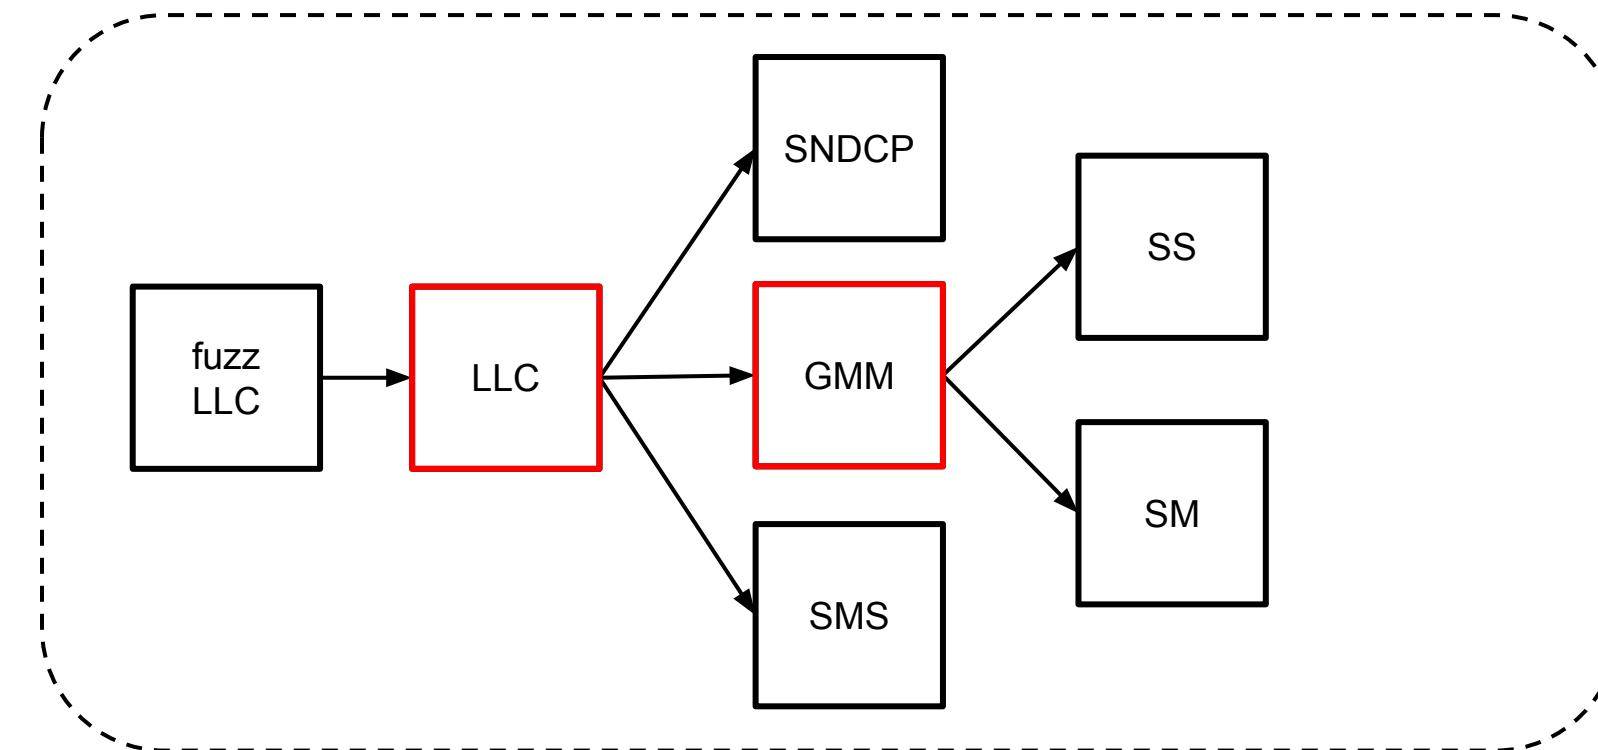

*let's take the fuzzer for a spin*

```

  - Heap Sanitization (Pixel 8)
  - Stack Canaries
  - More consistent use of XN
  - Allow 2G

Hardening cellular basebands in Android

December 12, 2023

Pixel's Proactive Approach to Security: Addressing Vulnerabilities in Cellular Modems

October 3, 2024

Allow 2G

2G is less secure, but may improve your connection in some locations. For emergency calls, 2G is always allowed.

---

# Conclusion

- Basebands have been extensively analysed in the past
  - o Yet, new approaches may still yield plenty undiscovered bugs
- Undiscovered bugs have a long lifetime in baseband firmware
  - o And can have cross-vendor implications
- Vendors approaches to baseband security are changing
  - o In a good way!
